Problem

- Conventional local search serves simple sequential requests
- Abstract overview and analysis of geographic regions are not supported
- In touristic and relocation scenarios users look for the makeup of regions

Approach

- Cluster of geospatial Web pages to characterize geographic regions
- Use of keyword distributions for comparison of regions
- Interactive interfaces for the visual exploration of relevant regions

Characterizing regions

- * Region of interest: drawing on map (query-by-spatial-example)
- * Target regions: placing markers or a generic grid overview

Relevance visualization

- * Ranking of regions with KL divergence similarity
- * Heatmap visualization of relevance

Exploration & interaction

- * Word clouds representing the most prominent keywords
- * Move, edit, and delete operations, revisualization
